

AMDG / ABES — Functional Architecture (v0.2 · reconciled with OmniSync)

Executive functional map + readiness heat-map. Structure = Hannah's **OmniSync gated/staged architecture** (Box · AMDG InfraDesign); business overlays from the 6/24 "Hannah x Mike // Connect on Architecture" call.

 In place  In progress  Planned / target  Gap / at risk  Open decision  gate / **red hex = HUMAN gate** → red = gated promotion to canonical

What changed v0.1 → v0.2 (reconciled with Hannah's OmniSync)

- **OpenClaw + Hermes are the CONTROL PLANE** (Execute + Orchestrate under a Local-AI "Reason" layer) — *not* a standalone de-identification DMZ as v0.1 drew. Today's stand-ins: Claude Desktop/Code → command queue → Notion AI/Claude Code.
- **The "air-gap" = default-deny INGESTION GATES.** De-identification/promotion happens at the gates (per-task, dependency-layer, runtime, and a human gate for BAA/key-ceremony/compliance/go-no-go). Default is *don't move*; data stays local unless a rule promotes it.
- **The "data warehouse" = the local-first CANONICAL SUBSTRATE** — Postgres append-only custody + Neo4j/Graphiti knowledge graph + MinIO (and pgvector). It's local-first by design, so the open call is a *sovereign-substrate host*, not a cloud DW (Snowflake was ruled too costly).
- **Canonical vs projection is the core invariant.** Notion / AppFlowy / Affine / Plane are all *projections* — derived, regenerable, never the source of truth.
- **Staged migration by substitution:** Stage 1 Notion orchestrator (now) → Stage 2 Notion control plane → Stage 3 AppFlowy (control) + Affine (content). Notion ends as a sanitized egress edge.
- **Storage decisions (2026-04-17):** NATS (not Redis); Postgres custody → Neo4j CE + pgvector (not Directus); MinIO; bge-m3 + local 8B/14B with cloud escalation.

Open decisions

- **Canonical-substrate host** — Hetzner vs Azure vs hybrid-local (Cissy: cost + BI fit).
- **All-cloud vs hybrid-local inference** — sovereignty vs ops overhead.
- **Azure vs AWS vs mixed** — Azure BAA out-of-box; AWS cheaper/BYO-model processing.
- **JumpCloud go/no-go** — Mike: business case to Brian (48h).
- **DevSecOps / SRE hire** — current gap; HIPAA audit + reliability = full-time.
- **Plane vs Notion/AppFlowy** — reconcile the team PM surface with the OmniSync projection staging.
- **ERPNext's role** — system-of-record that is both an input source and a sanctioned store (PHI held separately); confirm placement vs the graph.

Owners / next steps

- **Mike** — this functional map (single source of truth); JumpCloud business case to Brian (48h).
- **Hannah** — OmniSync technical build; split network / infra / data-flow lenses; keep canonical-vs-projection discipline.
- **Cissy** — substrate/warehouse host options + cost + BI-tool fit (ERPNext Insights).
- **Team** — Brian BI/pipeline workshop; resolve contractor access to IP/data.

Guiding principles (north star)

- Max agent delegation; humans gate only the unavoidable. Nothing advances without a gate; default-deny.
- Own your canonical state; everything else is a projection. Migrate by substitution, not rebuild.
- Adversarial-first; verification is the unit of trust. Skeleton (gated plan) + muscle (tight loops).
