

AMDG / ABES — Architecture Pack (slop-reviewed)

Functional + physical/deployment views, reconciled with Hannah's OmniSync docs. CANONICAL = OmniSync docs; Δ **overlay** = 6/24 call (confirm). Full audit: TECHNICAL_REVIEW.md.

 In place  In progress  Planned/target  Gap  Open decision  Δ call overlay (confirm)  red = gated/HIPAA path · sole NATS bridge

1 · Functional view (v0.3)

COMPLIANCE · HIPAA + DATA SOVEREIGNTY

CMK encryption ·
TLS/HMAC · Tailscale
segmentation · audit
logging · row-level access ·
default-deny · local-first

integration TBD · confirm

△ BUSINESS SYSTEMS & OVERLAYS — 6/24 call · placement vs substrate TBD (confirm)

△ ERPNext · Rethink · QuickBooks
business system-of-record

△ Metabase BI ← TIC/Cacheware C++
pipeline (AWS)
separate existing analytics
· ERPNext Insights candidate

△ JumpCloud — SSO / identity (business case pending)

ZONE 4 · PROJECTION SURFACES — derived, staged, never source of truth

Obsidian vault
current EA context
projection

Stage 1 · Notion
orchestrator — CURRENT

△ Plane — team PM
surface (reconcile vs
Notion/AppFlowy)

△ DevSecOps / SRE
owner — TO HIRE

Stage 3 · AppFlowy
(control) + Affine (content)
— TARGET

Notion → sanitized edge
(egress)

2 · Physical / deployment view (v0.1) — VLAN trust zones

Source: omnisync-plan §3. AI zone has **no WAN**; **NATS is the only inter-zone bridge**; cloud escalation only via the de-identifying, logged DMZ proxy. Zoning is the invariant; **where each zone lands is the open hosting decision**.

3 · Technical review — slop found & corrected

#	Slop / error	Source it violated	Correction
1	pgvector bundled into the MinIO node	§3: vectors = Postgres+pgvector; MinIO = recordings only	Split into two stores
2	Metabase labelled as the OmniSync telephony lane	Anchor lane = Zoom Phone; TIC/Cacheware → Metabase is a separate AWS analytics pipeline	Moved Metabase to △ overlay (AWS BI)
3	ERPNext/Rethink/QuickBooks inside Zone 1 inputs	OmniSync sources = email/transcripts/calls/calendar/docs — not these	Moved to △ overlay (placement TBD)
4	Substrate host omitted the on-prem target	§3: target = on-prem MSI/Hyper-V/Unifi, AI zone no-WAN	On-prem stated as target; cloud listed as open alternatives
5	No provenance distinction (root cause)	—	Added △ overlay convention + legend; quarantined call nodes
6	Deployment build error (linkStyle 20/21)	only edges 0–19 exist	Re-indexed; renders clean
7	Plane/Notion asserted in VLAN 10	§3 shows Obsidian (V10) + AppFlowy/Affine (V20)	Tagged △ overlay (confirm)
8	JumpCloud shown as canonical identity	Not in §3; Tailscale is	JumpCloud → △ overlay; Tailscale stays canonical
9	EA/personal-assistant lane missing	§BLUF: EA (email+transcript) is the first MVP	Added lane tags ★ anchor / ♦ MVP-EA

Open reconciliation items (genuine team decisions — not slop)

Plane vs Notion/AppFlowy (human/PM projection) · ERPNext's role vs the canonical graph · Hosting placement (on-prem sovereign target vs Hetzner/Azure/hybrid — zoning is the invariant) · Which lane is funded first (ABES telephony anchor vs Bryan EA MVP). **Build context:** engine cherry-picks KGM's sovereign skeleton + AI-memory subsystems; `deploy/` not yet stood up (S1) — most substrate nodes are *planned/target*, not running.
