

AMDG / ABES — Functional Architecture (v0.1 starting draft)

A single-source-of-truth functional map to set vision & align the team. Source: Fathom call "**Hannah x Mike // Connect on Architecture**" — 2026-06-24 (Mike Adkins, Hannah Schuele, Cissy Byrd). Boxes = capabilities; color = readiness heat-map.

 In place / operational  In progress  Planned  Gap / at risk  Open decision  red = HIPAA / PHI path  purple = access/identity

Guiding principles (the vision, from the call)

- **Separate human work from AI work** — a human control plane (Plane) vs an AI/agent control plane (AppFlowy), so agents can't corrupt curated schemas.
- **PHI never crosses untreated** — an air-gap DMZ de-identifies & anonymizes before data enters the AMDG environment; neither side knows the other. De-identified ≠ HIPAA-safe unless it can't be re-linked.
- **Consolidate & simplify; proven over custom** — "you're not that special": ~80% of needs are off-the-shelf; spend rigor on the 20% showstoppers. Pick a horse and go.
- **Data governance & sovereignty** — the bet that SaaS is dying; keep control of data. But don't become a security company — outsource what isn't worth owning.
- **Decision rigor for shared infrastructure** — buy-vs-build gate: does the control gained justify the risk/overhead vs speed of execution?

Open decisions (the heat-map's amber)

- **Data warehouse host** — Hetzner (storage box, caveats) vs Azure vs AWS; Snowflake too costly now. *Cissy: research cost + BI fit (incl. ERPNext Insights).*
- **All-cloud vs hybrid-local inference** — local "beef box" mirrored to cloud for redundancy vs fully hosted.
- **Azure vs AWS vs mixed shop** — Azure = BAA out-of-box + tenant admin; AWS = cheaper/BYO-model processing (TIC pipeline already there).
- **JumpCloud go/no-go** — *Mike: business case to Brian within 48h.*
- **DevSecOps / SRE hire** — HIPAA audit + reliability is a full-time role; currently a gap.
- **Config lenses** — AMDG vs AIBs vs AMDG-for-AIBs (drives access & HIPAA policy).

Owners / next steps

- **Mike** — this functional diagram (single source of truth); JumpCloud business case to Brian (48h).
- **Hannah** — drop notes/diagrams in Box `AMDG InfraDesign` ; keep chipping the technical side; split into network / infra / data-flow lenses.
- **Cissy** — data-warehouse options + cost + BI-tool fit.
- **Team** — Brian to run a workshop on the existing BI/pipeline build; resolve contractor access to IP/data.

Naming to confirm

- Transcribed terms to verify: **Affine** (AFFiNE?), **AppFlowy**, **OpenClaw**, **Hermes**, **AIPS** (clinical PHI source), **TIC / Cacheware** C++ pipeline, **Hetzner**. Heat-map readiness is a first read — adjust per actual state.
